

Pallet Netting Elastic

100% virgin MPE stretchable knitted pallet net

Pallet nets are knitted rather than cast as a sheet, so most of the pallet face stays open. Air moves through the load almost as freely as if it were unwrapped, which is why netting is used where a load must be contained and cooled at the same time. Pallet nets can be customised to your request, and manual and automatic use are both available.

Specification

Item	Specification
Material	100% virgin MPE
Stretch rate	15% to 50%, determined by weight
Roll widths	30 cm / 50 cm / 76 cm
Inner core diameter	3 inch or 2 inch, to your request
Manual rolls	500 m to 1000 m
Automatic rolls	3000 m to 4000 m
Application	Manual and automatic use are both available
Customisation	Pallet nets can be customised to your request

Where It Is Used

- Mixed pallets where case sizes vary across a layer
- Compressible goods that lose height under their own weight
- Long road and sea legs where vibration settles the load
- Nursery and plant shipments with uneven heights
- Any load that is tight at dispatch and slack on arrival

How The Stretch Rate Works

The stretch rate is a range rather than a fixed figure because it is determined by the weight of the load. A light pallet draws the net toward the lower end of the range and a heavy pallet toward the upper end, so holding force scales with what is on the pallet. As the load settles in transit the net recovers and stays in contact.
